

# Node RED on IBM i Workshop

Andy Youens

FormaServe Systems Ltd

IBM Champion 2021, 2022 & 2023

# Presenter - Andy Youens

# FormaServe

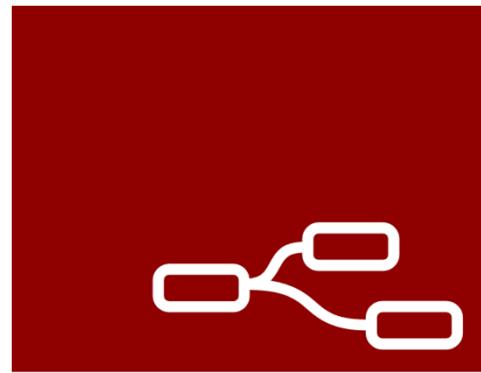

- We are proud to be a leading IBM i software vendor with a remarkable track record of over 33 years
- We offer comprehensive IBM i training courses, both remotely & on-site, to equip individuals & teams with the necessary skills & knowledge
- As open-source on IBM i specialists, we possess deep expertise in leveraging open-source technologies to enhance & optimise IBM i environments
- Our team comprises of modernisation experts who can guide you in transforming your IBM i to embrace modern practices & technologies
- Part of IBM ISV Advisory Council
- **Provide Open-Source support to i-UG education initiative**

- FormaServe & NC Communications have announced a strategic partnership to publish PowerWire
- Do you want to write a blog for us & share your insights & experiences with the IBM i community?
- Do you want to advertise with us & reach thousands of potential customers & partners in the IBM i market?
- Give me a shout!

# Agenda

**Node-RED**

Node-RED Introduction

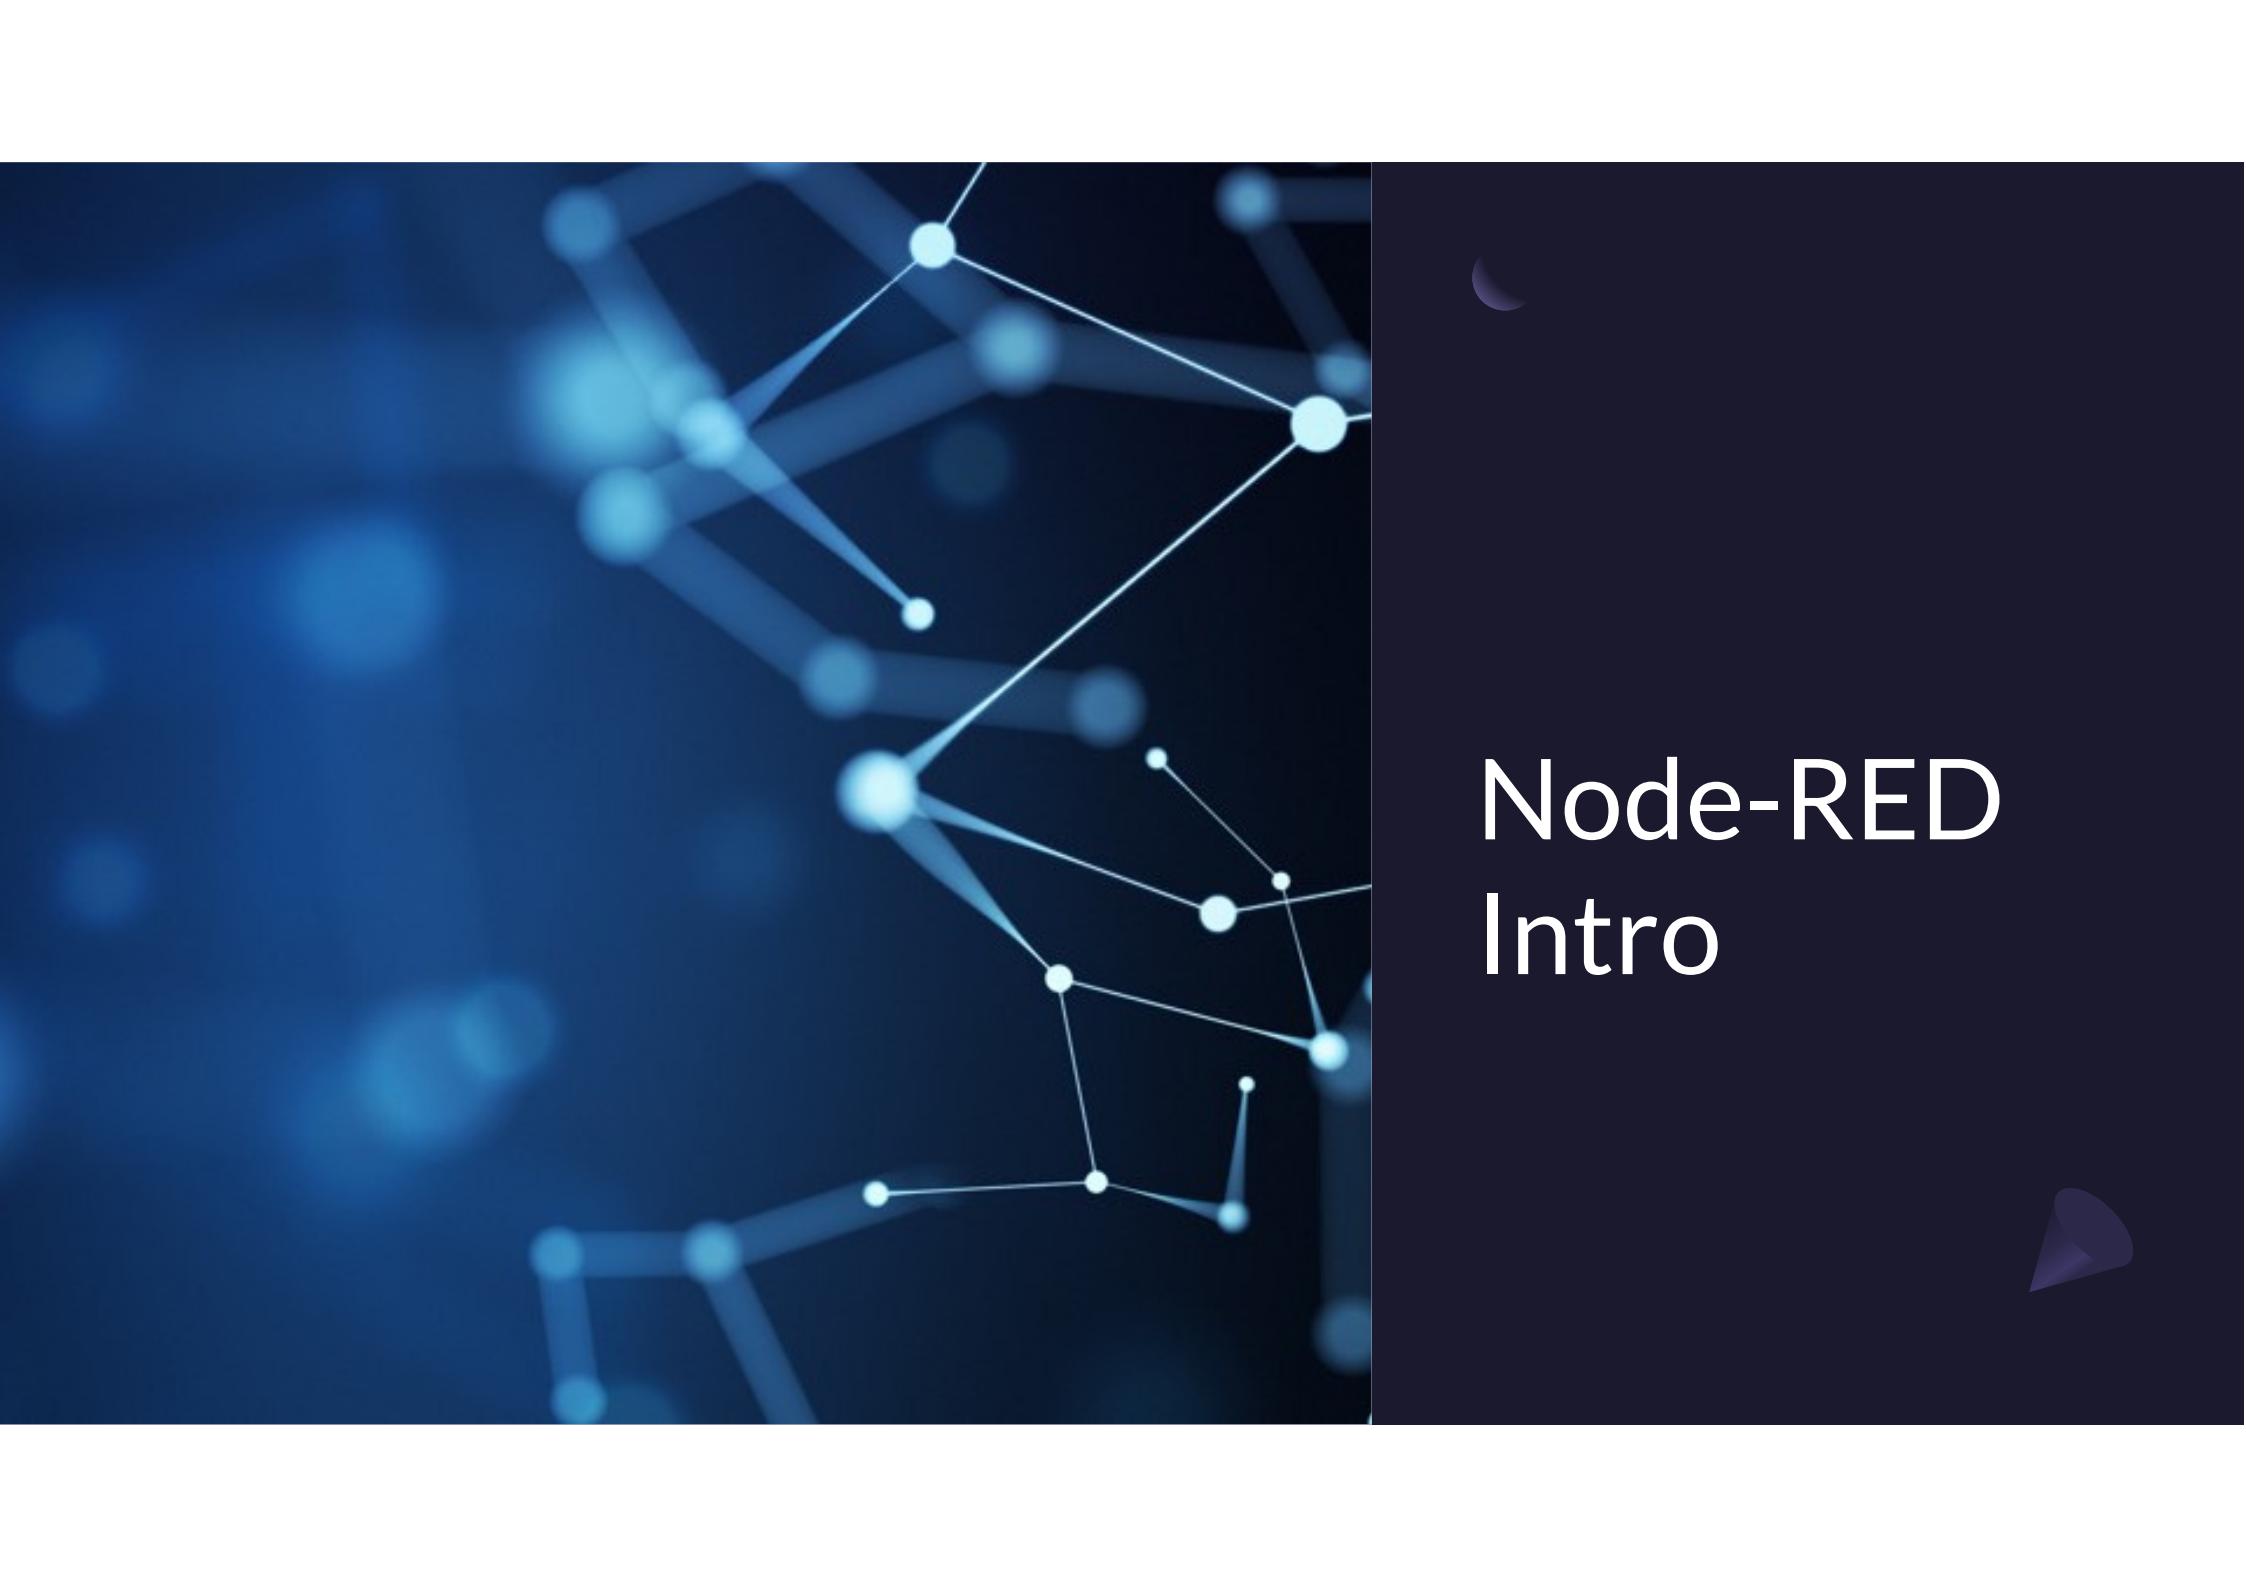

IBM i Installation

Messages

Node-RED

IBM i Integration

Node-RED Extras

A dark blue background featuring a complex, glowing network graph composed of numerous small, semi-transparent blue spheres connected by thin white lines, creating a sense of depth and connectivity.

# Node-RED Intro

# Overview

---

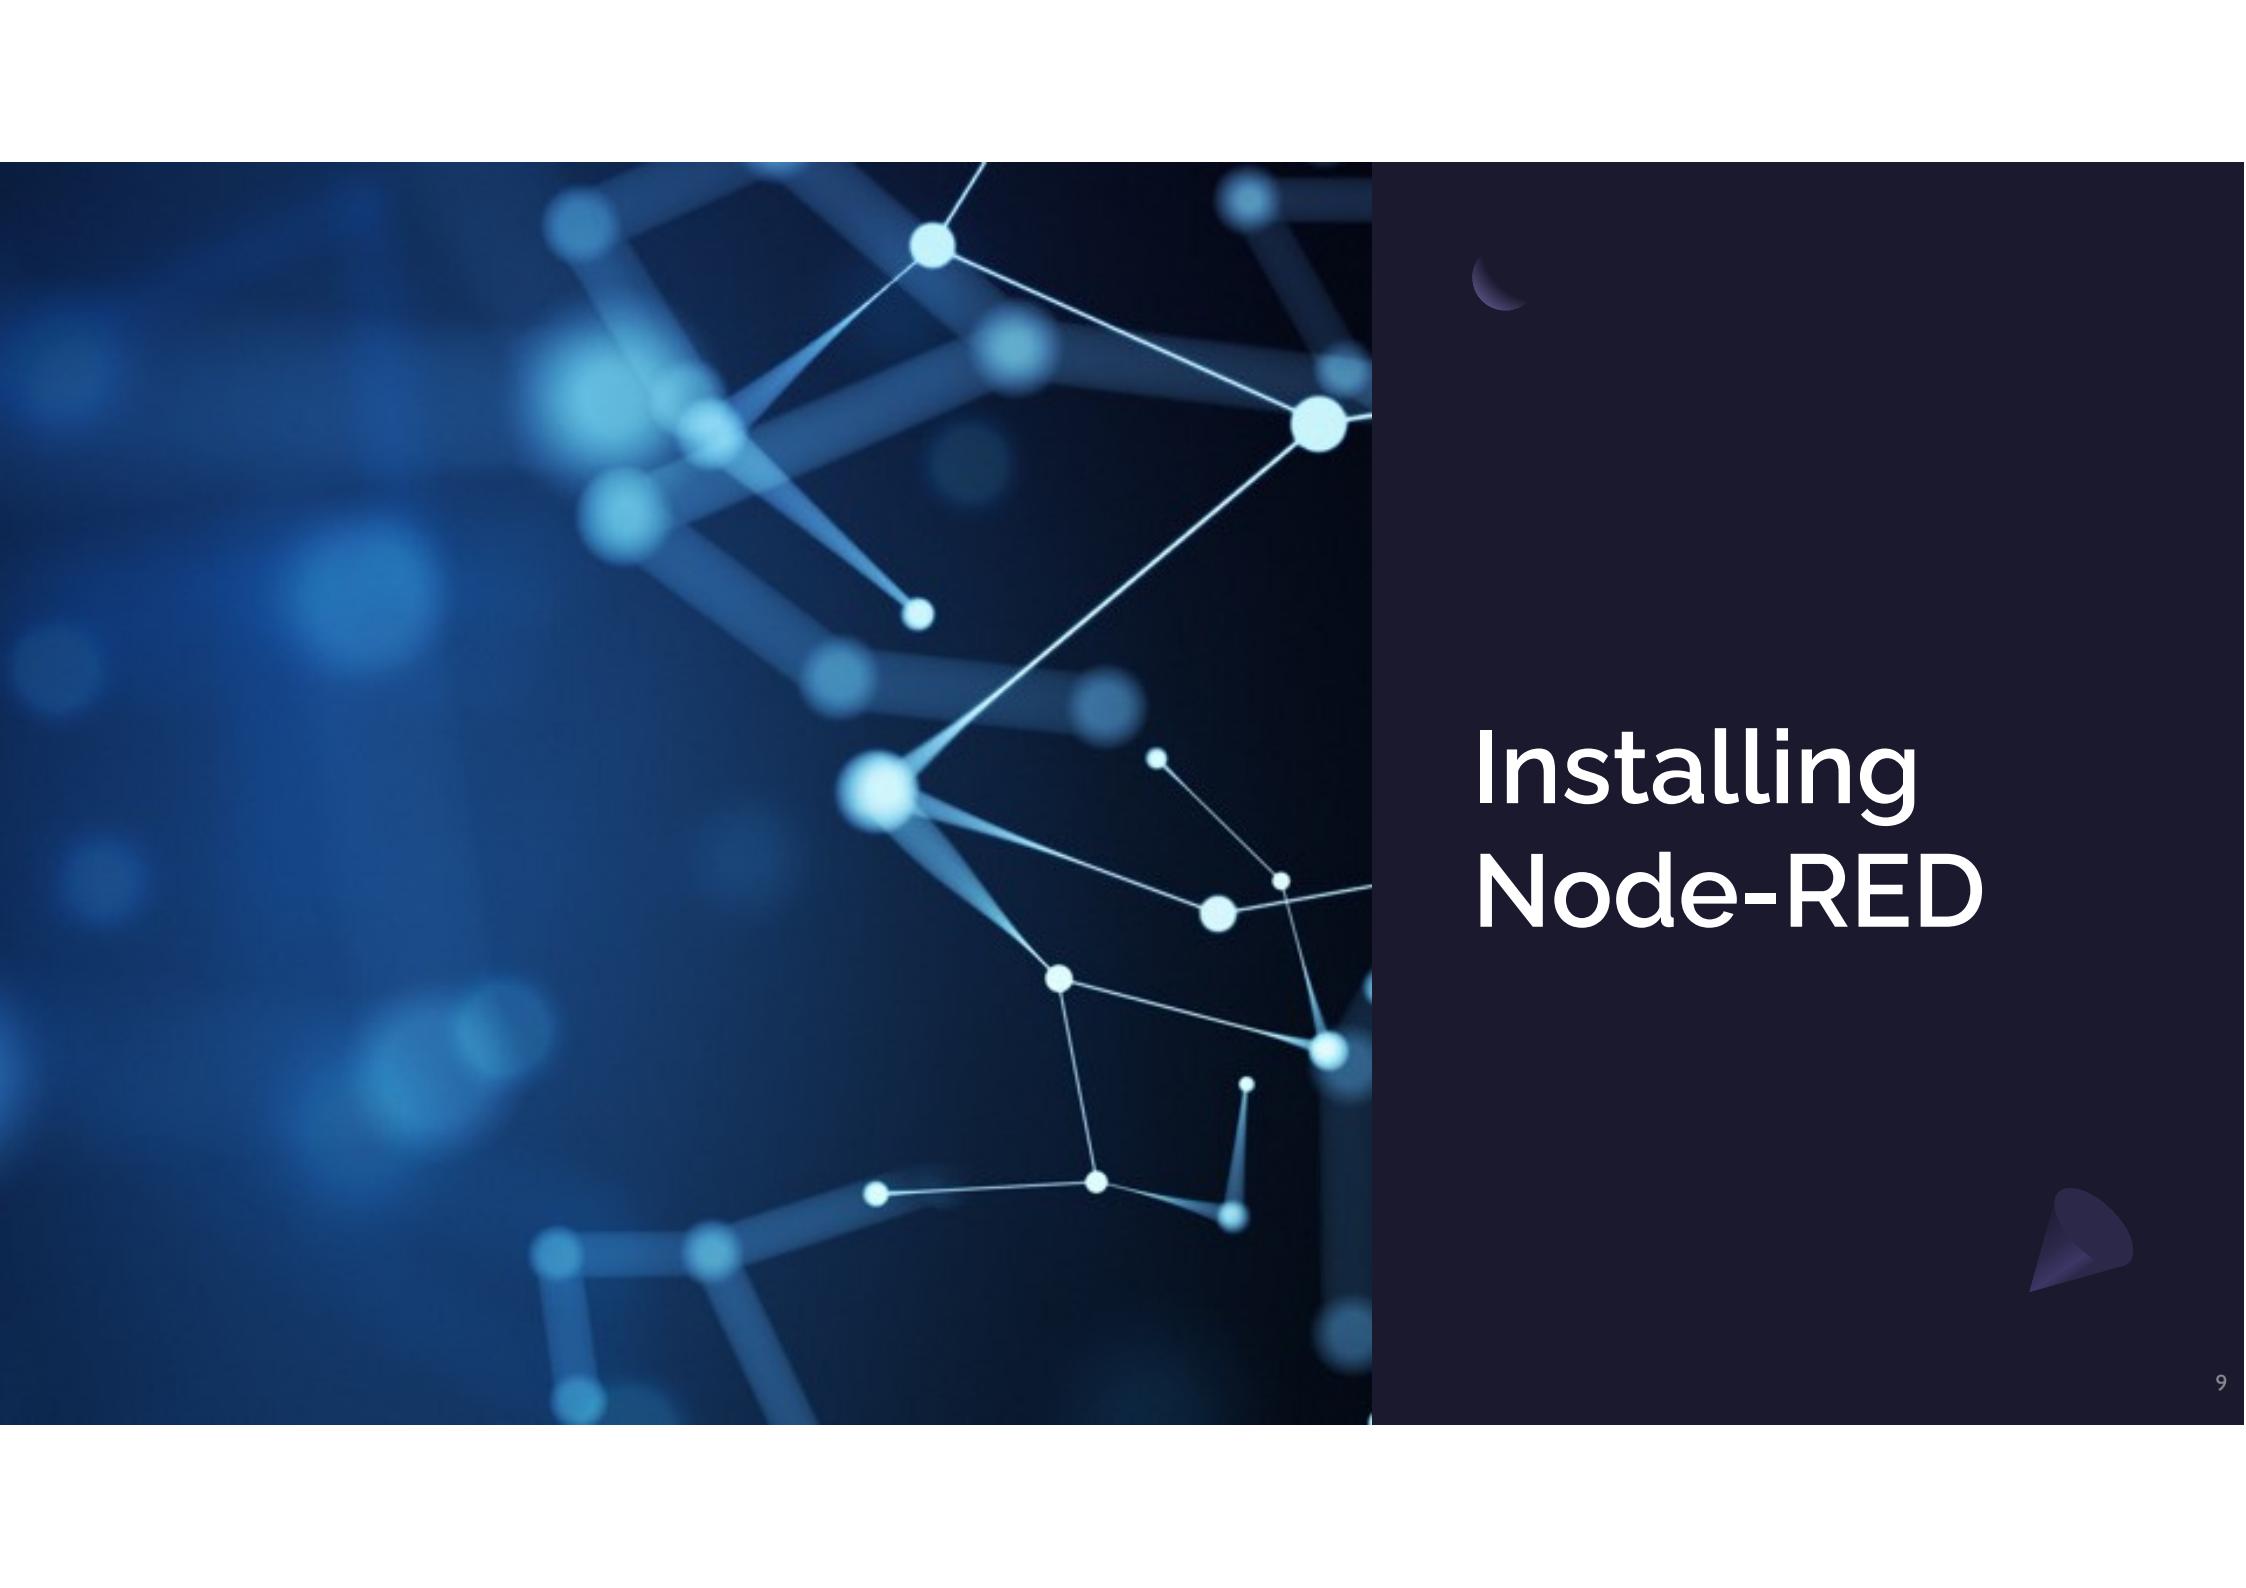

Congratulations!

- Code generator developed for communicating with IOT devices
- Initially developed by IBM in 2013
- Built on Node.js
- Maintained by [OpenJS Foundation](#)
- Open Source - join in!
- Generates JavaScript & Node.js code
- A visual programming tool
- Just like a flow-diagram!

# Node-RED Platforms

- Red Hat/Fedora/CentOS
- Raspberry Pi
- Docker
- Windows
- Android
- AWS
- Azure
- IBM i

A dark blue background featuring a complex, glowing network graph composed of numerous small, semi-transparent blue spheres connected by thin white lines, creating a sense of depth and connectivity.

# Installing Node-RED

# Installing Node-RED on IBM i

- Pre-Reqs

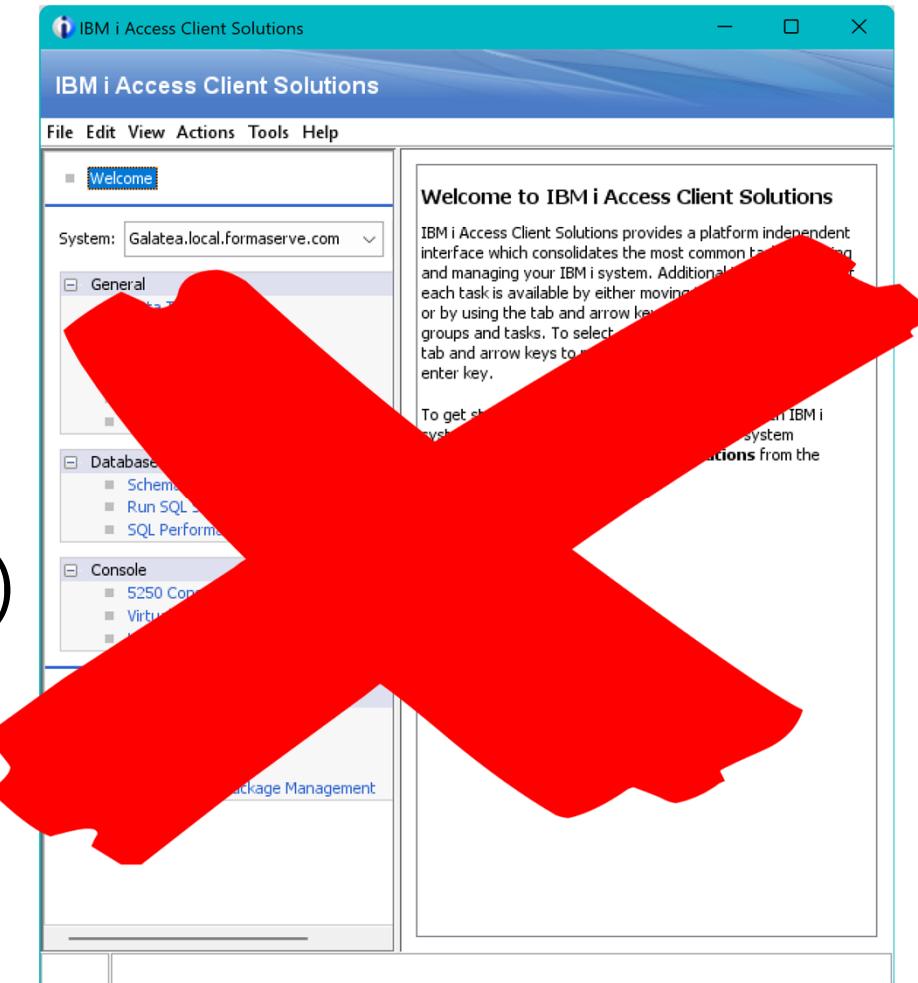

- Node 18 or > installed
- PASE (5770SS1 Option 33)
- OpenSSH (5733SC1 Option 1)

- Version 3.1.0 current (Nov 23)

- No ACS or Yum install

- NPM is used to install

- `npm install -g node-red`

# Node-RED - Two Parts

---

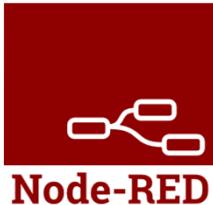

## 1. Run-time

- Runs your flows

## 2. Editor

- Browser-based editor

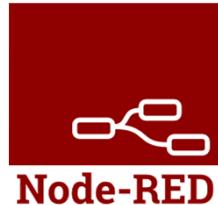

# Node-RED Ports

- Both the server & editor runs on TCP/IP port number **1880**
- **Each user has its own flow & settings!**
- For multiple users, change the server port number
  - Use environment variables (**EXPORT PORT=1881**)
  - Change users BASH profile (**~/.profile**)
  - Change Node-RED settings file (**settings.js**)
  - Specify port number when starting server
    - **node-red -p 1881**
- Use **scopenports** to check ports available

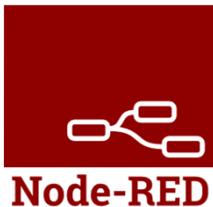

# Starting Node-RED

- You have to start the server, in a shell session
    - `/QOpenSys/pkgs/lib/nodejs20/bin/node-red`
    - Just `node-red` if in path

 Check  
for  
errors!

# Node-RED Terminology

## Flows

- Flows are visual code, or programs

## Nodes

- Nodes are small pieces of code doing a specific job

## Connectors

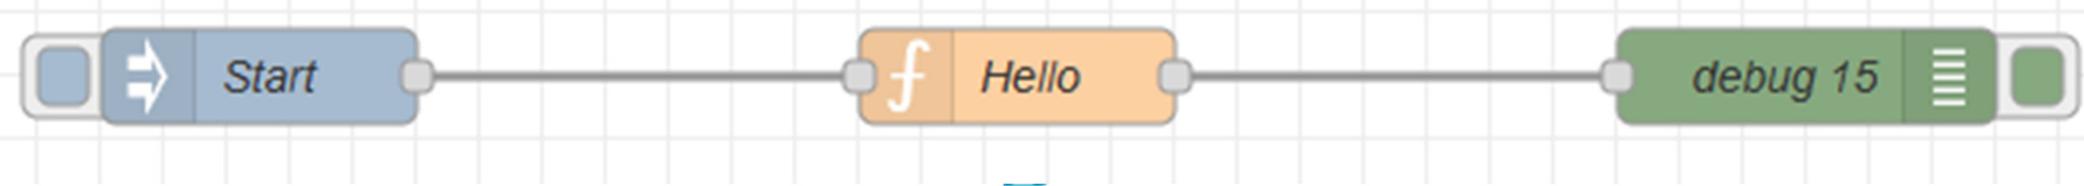

- Connectors are the small squares attached to the nodes

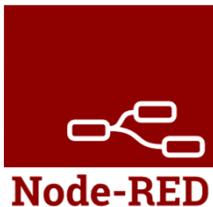

## Wires

- Wires shows the flow from one node to another

## Deploy

- Creates the program that is run

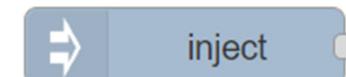

# Node-RED Nodes

- There are three main types of nodes

- Input Nodes** (e.g., inject)

- Output Nodes** (e.g., debug)

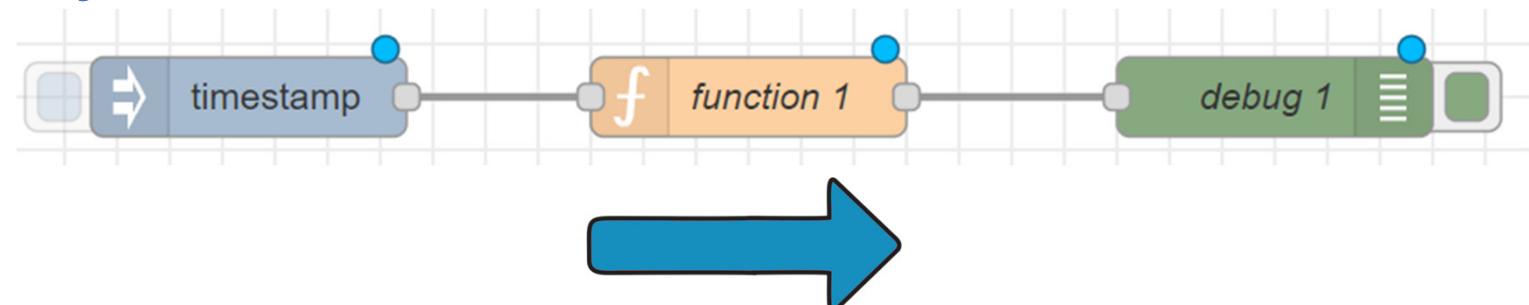

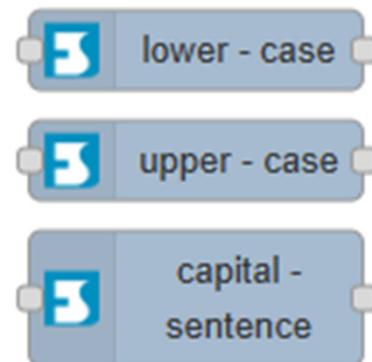

- Processing Nodes** (e.g., function)

- No need to 're-invent the wheel!'

- You can create your own!

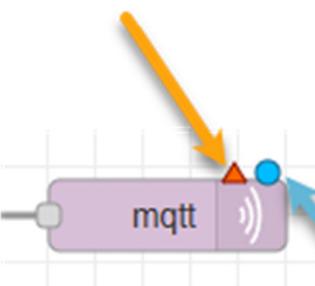

The screenshot displays the Node-RED interface with several key components highlighted:

- Main editor window**: The central workspace where flows are built using nodes like timestamp, debug, Do nothing, Set Message, Uppercase, Topic1, Topic2, Split topic, and Show MSG Object.
- Nodes**: A palette on the left containing categories such as common, function, and network, each with various node icons.
- Info Panel**: A panel on the right showing details for selected nodes, such as "Show MSG Object" with Node ID "aa7127cc68f009bb" and Type "debug". It also includes a note about pressing enter to edit the first node in the current selection.
- Generate Code & Menu**: A feature located in the top right corner.
- Multi Tabs**: A feature allowing multiple tabs to be open simultaneously.

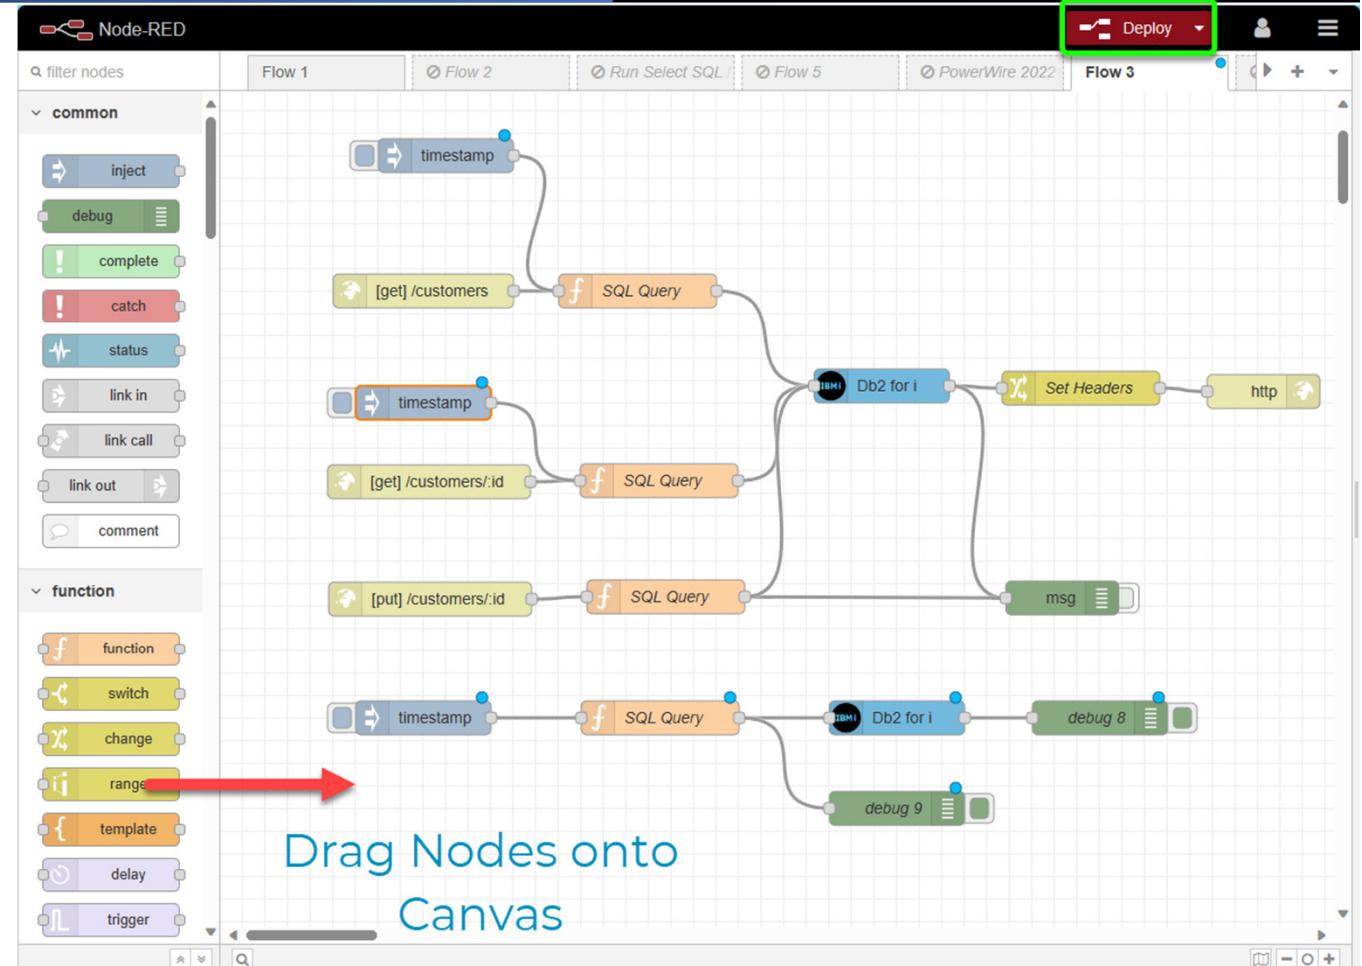

Annotations with arrows point to the Nodes palette, the Info Panel, and the Multi Tabs feature.

# Node-RED Canvas

**Not Configured!**

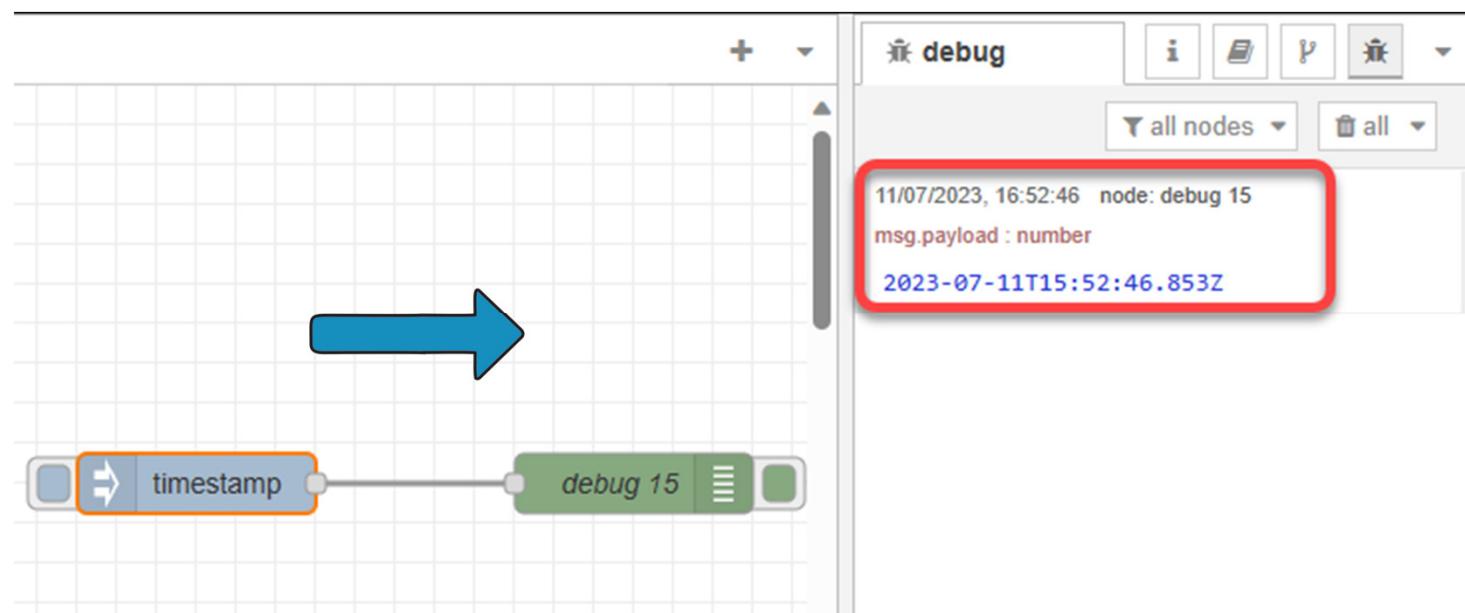

**Not Deployed!**

# Demo & Exercise

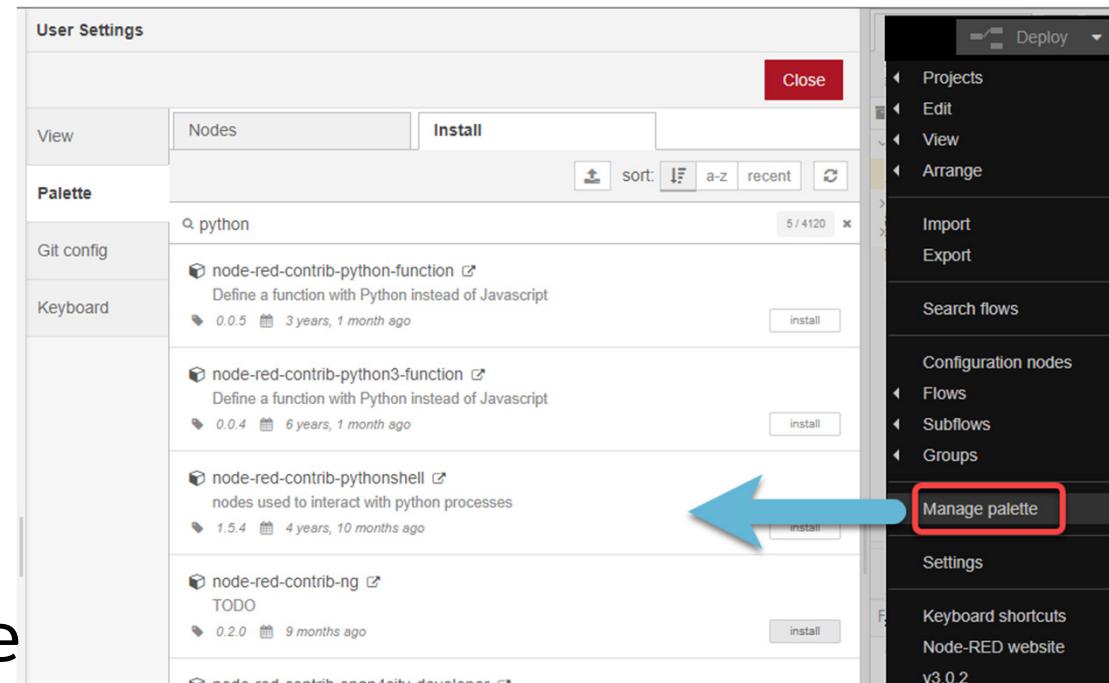

---

- Explain the Node-RED canvas
- Create a first flow by wiring a timestamp node to a debug node

# Node-RED Adding Extra Nodes

- Extra nodes can be added that extends the core of Node-RED
- From menu
  - Select Manage Palette

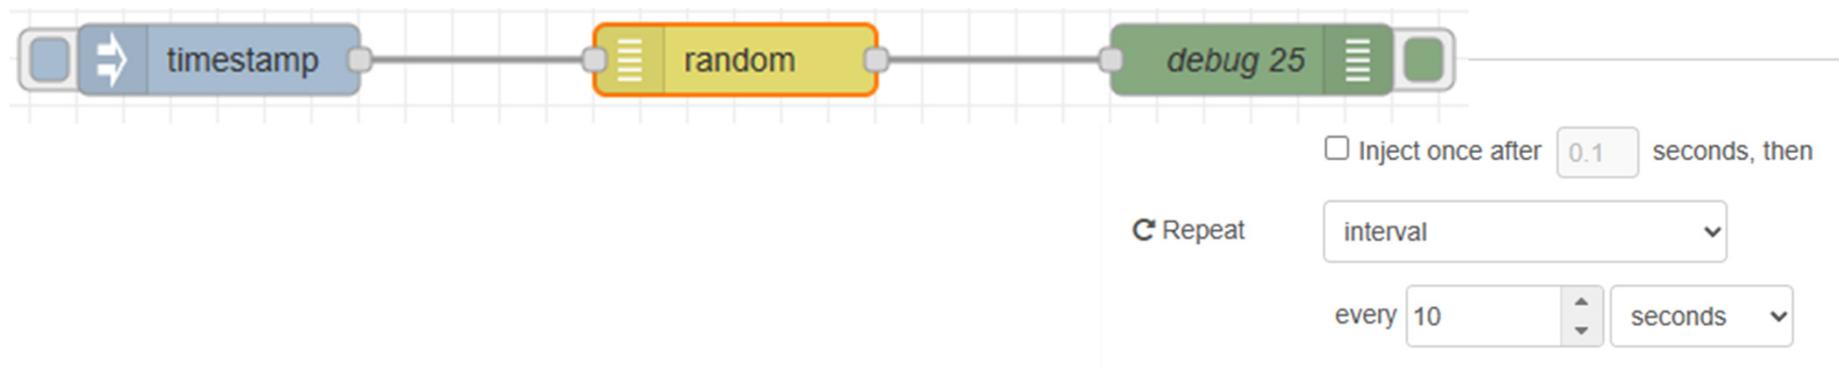

- Over 4.5k nodes available

# Demo & Exercise

- Add the **random** node to your palette ([node-red-node-random](#))
- Create a flow using the random node picking a number from 1 to 100
- Make your flow run automatically every 10 seconds

# Flows

## Import

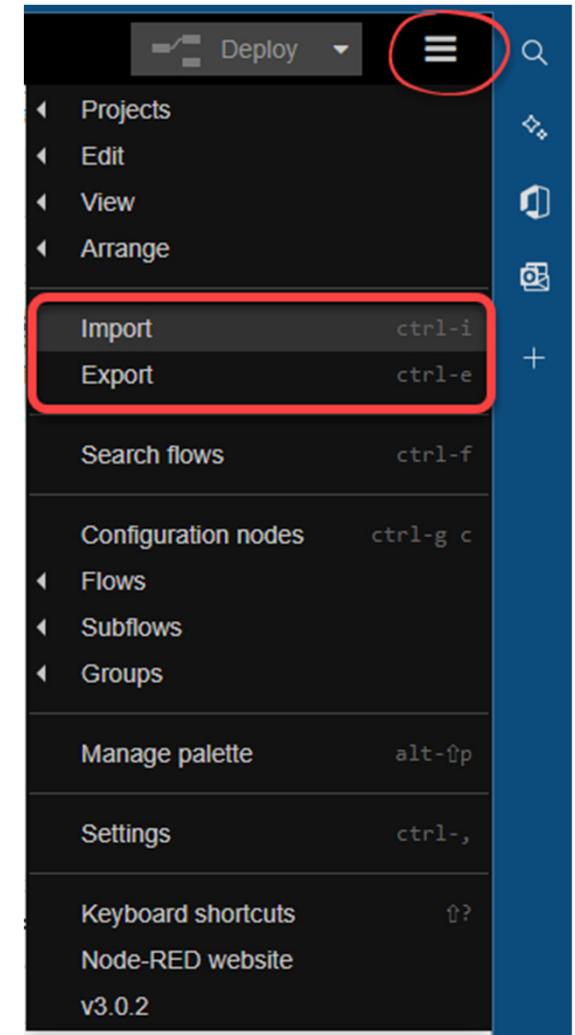

- Import from your file/clipboard

## Export

- Export from your file/clipboard

## Both great for

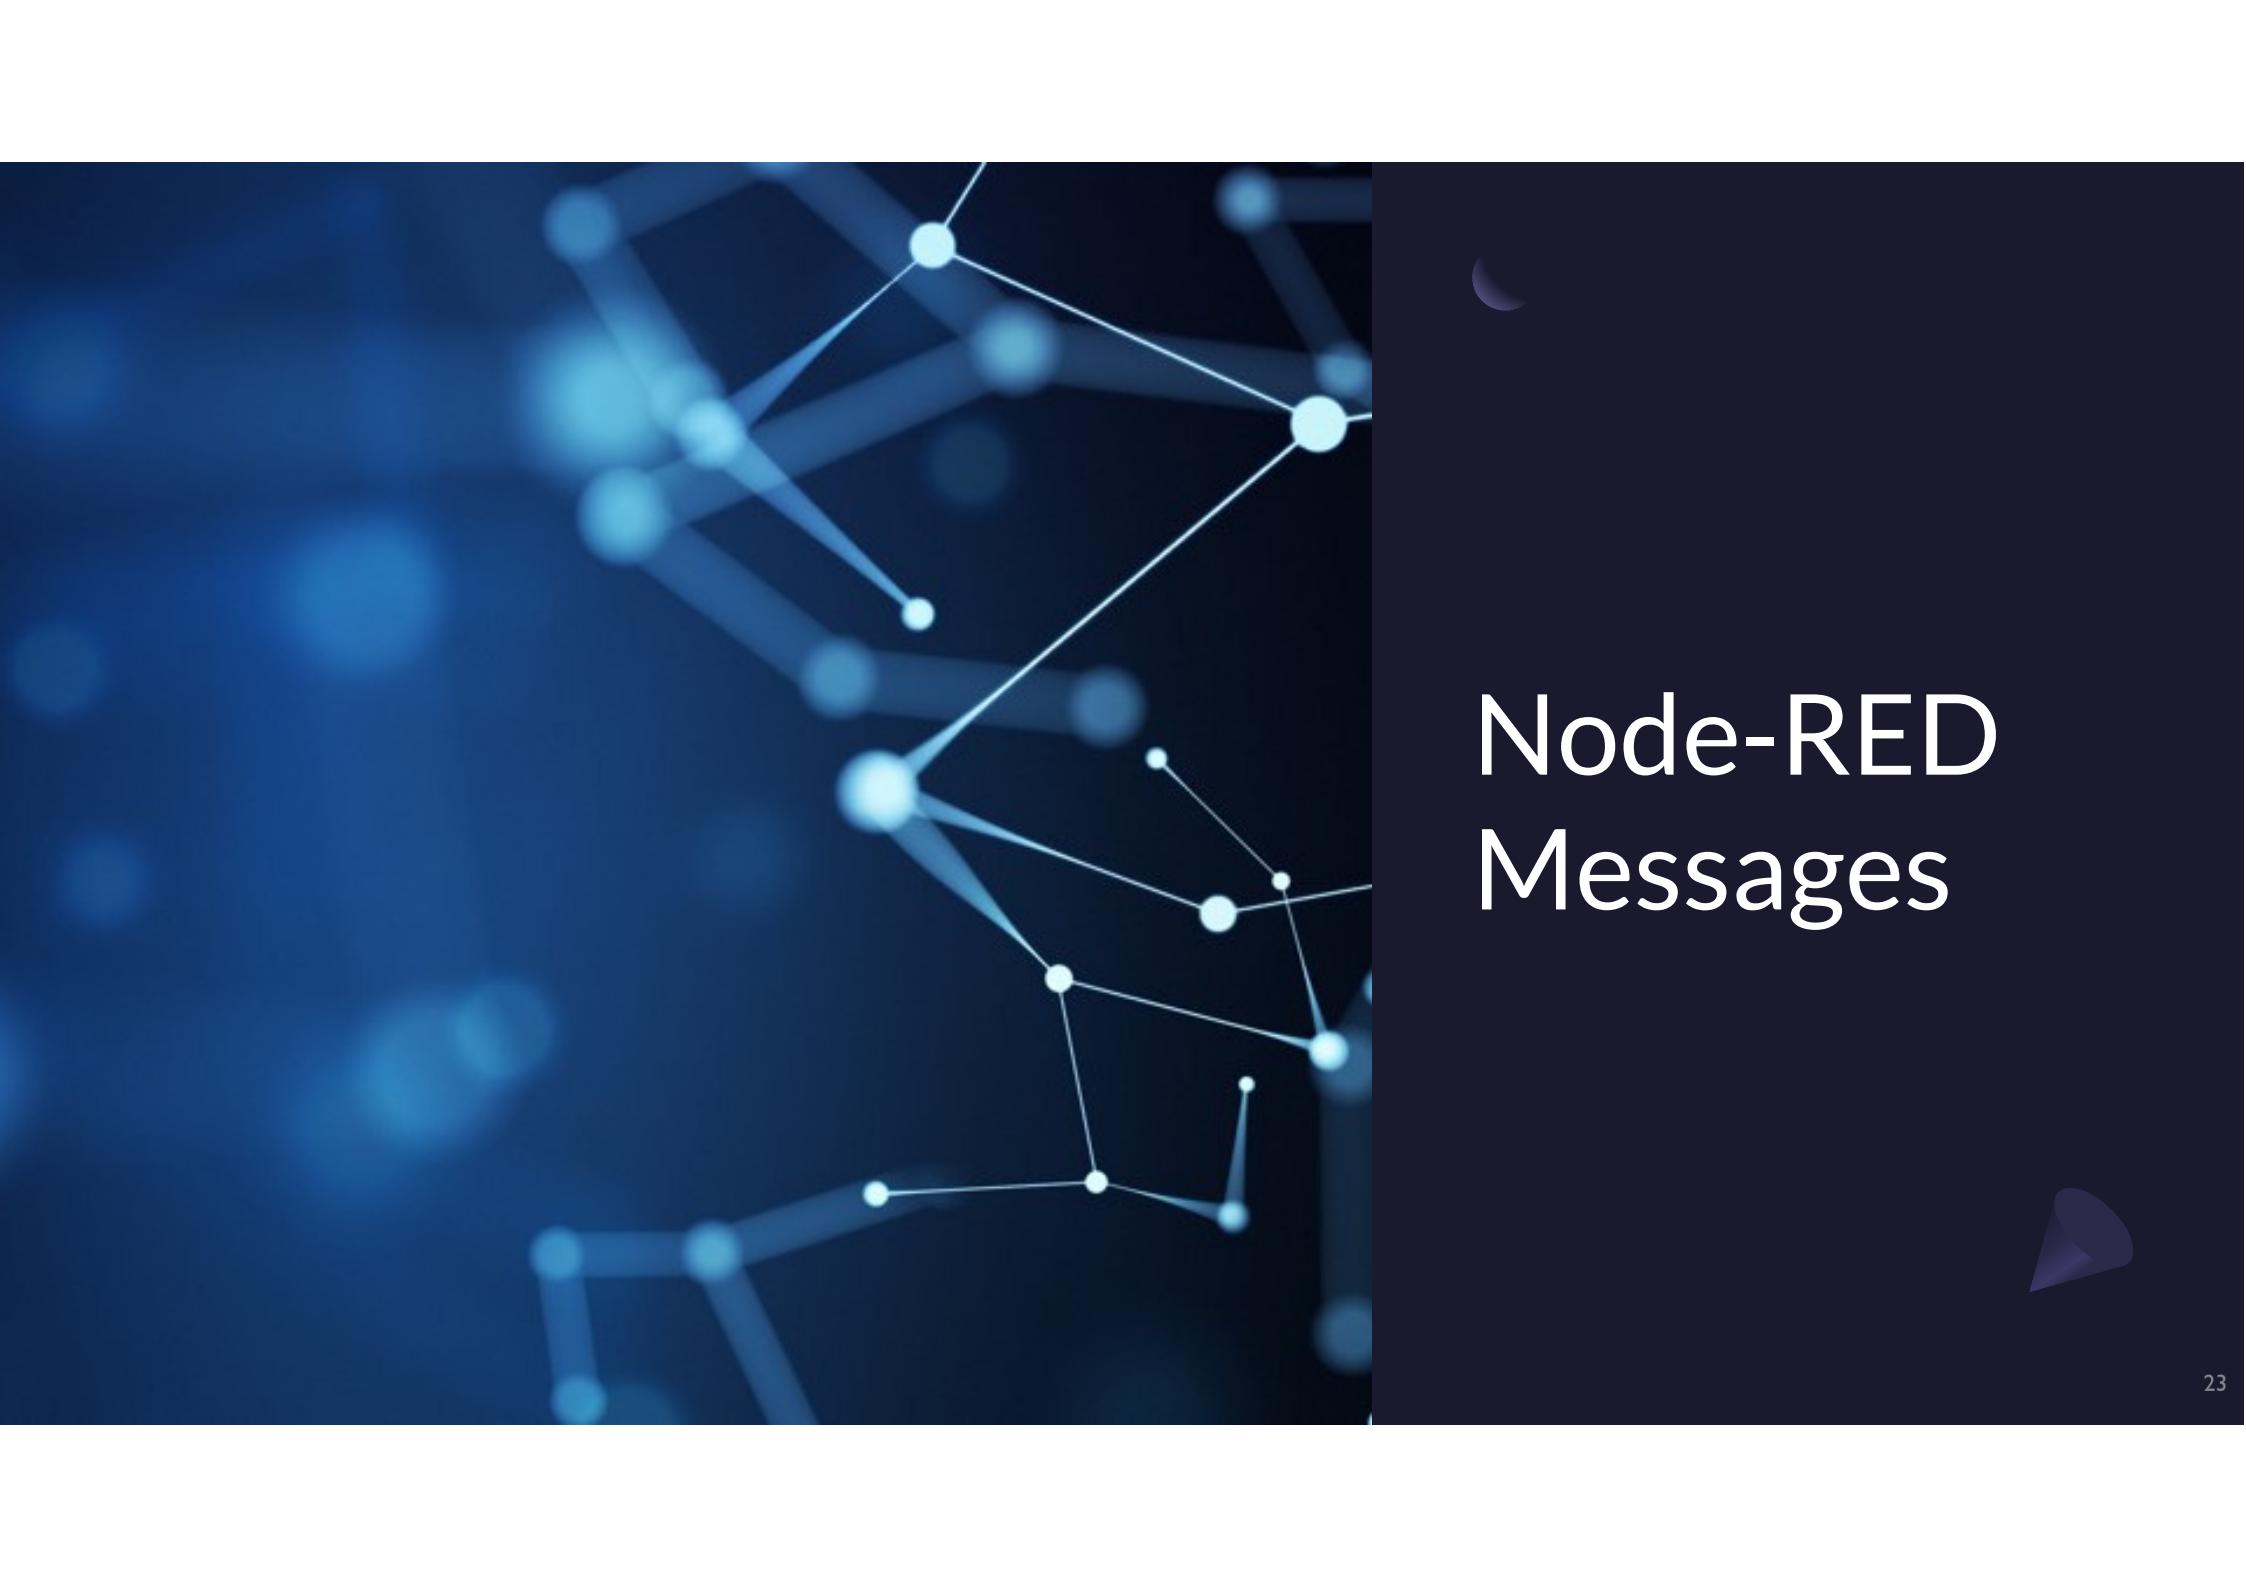

- Taking backups
- Storing on GitHub
- Support
- Experimental, POC etc

# Demo & Exercise

---

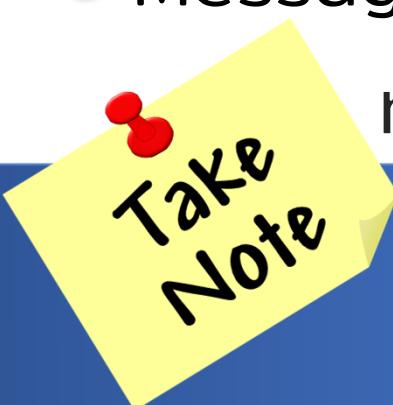

- I'll use one of the many flows on the Node-RED website <https://flows.nodered.org/>
- I'll import it into a new flow in my browser
- I'll deploy it & run it

A dark blue background featuring a complex, glowing network graph composed of numerous small, semi-transparent blue spheres connected by thin white lines, creating a sense of depth and connectivity.

# Node-RED Messages

- The message gets passed between nodes
- It is the only method of communicating between nodes
- It's a JavaScript object
- It has properties
  - `msg.carManufacturer = Ford`
  - `msg.carModel = Capri`
- Messages usually have `payload` & `topic` property

`msg.payload` may get overwritten!

Take Note

Node-RED Message Object

# Node-RED Message Object

- ➊ Our car → message (abbrev. to msg throughout)
- ➋ It goes from A to B → from one node to another node
- ➌ It has properties
  - ➍ Manufacturer, make & model
  - ➍ It has a driver
  - ➍ It can have passengers & luggage
  - ➍ It has 4 wheels (array)
  - ➍ The wheels can have different tyres manufacturers

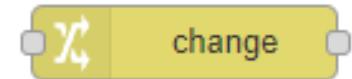

# Node-RED Message Object

- There are 2 ways you can change the properties of the message object
  1. **Change node** - No programming required
  2. **Function node** - Manipulate the object using JavaScript

# Node-RED Change Node

- It provides four basic operations:
  - Set a property to a value
  - Change a string property by search & replace
  - Delete a property
  - Move a property
- No programming skills!

Name: Set HTML Headers

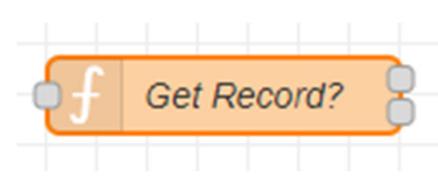

Rules:

- Set msg. headers to the value {}
- Set msg. headers.content-type to the value application/json
- Set msg. statusCode to the value 200

# Node-RED Function Node

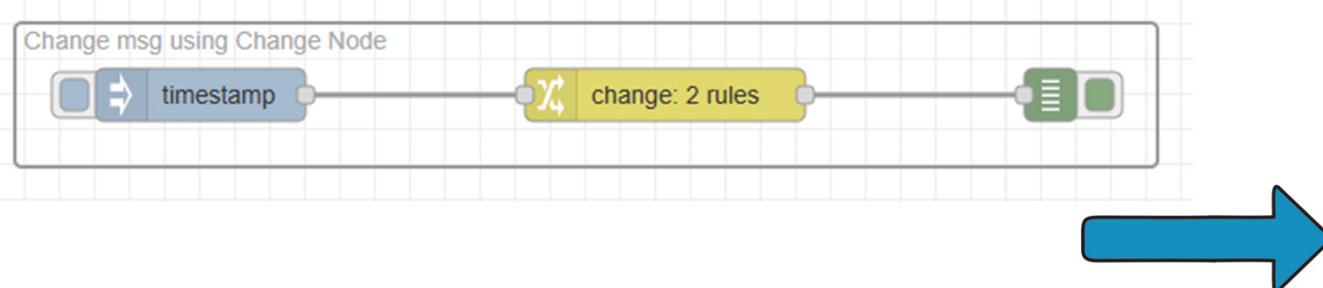

- Is used to run JavaScript code against the **message object**
- It accepts a **message object as input & returns message objects as output**
- The message object can have a payload property **msg.payload** & usually has other properties depending on the proceeding nodes
- Can have more than one output (not seen that often)

# Demo & Exercise

---

- Use a **change** node to change the **msg.topic** to have a value of **Random**
- Use the **change** node to give the **msg.company** variable some name
- Deploy & run your flow

```
17/07/2023, 11:43:52 node: debug 23
Random : msg : Object
  ▼ object
    _msgid: "e114c519bc4aa226"
    payload: 2023-07-
    17T10:43:52.724Z
    topic: "Random"
    company: "FormaServe"
```

# Demo & Exercise

- Use the **function** node instead of the **change** node

```
msg.topic = 'Random'  
msg.company = 'FormaServe Systems Ltd'  
  
return msg;
```

```
17/07/2023, 16:02:21  node: debug 1  
Random : msg : Object  
  ▼ object  
    _msgid: "5a81fa2a16839934"  
    payload: 1689606141224  
    topic: "Random"  
    company: "FormaServe Systems Ltd"
```

# What is JSON ?

# JSON

- JSON stands for **JavaScript Object Notation**
- JSON is a lightweight format for storing & transporting data
- JSON is self-describing & easy to understand
- Very powerful
- Supported by many languages
- A replacement for XML? - Yes, in many cases!

{ JSON }

# JSON

- JSON format is text only
- Data is in name value pairs
- Data is separated by commas
- Curly braces hold objects
- Square brackets hold arrays
- Objects can contain arrays
- Arrays can contain objects

# { JSON }

## No comments allowed!

# JSON Examples

- A **name:value** pair consists of a field name with a value
- In double quotes (no single quotes!)
- Name, followed by a colon, then the value

```
{ "name":"andy" }
```

# JSON Value Types

---

- A string must be in double quotes
- A number
- Boolean (true or false)
- Null
- An object { }
- An array [ ]

```
{  
  "name": "f-weather",  
  "version": 1,  
  "private": true,  
  "developer": null  
}
```

# JSON Examples

```
{  
  "name": "Andrew",  
  "Born": "London",  
  "age": 21,  
  "car": "Capri"  
}
```

Basic

```
{  
  "employee": {  
    "name": "Andy",  
    "salary": 56000,  
    "married": true  
  }  
}
```

Object

```
{  
  "cars": [  
    "Ford",  
    "BMW",  
    "Fiat"  
  ]  
}  
  
{  
  "id": 7,  
  "name": "Andrew Youens",  
  "age": 21,  
  "hobbies": {  
    "indoor": [  
      "Home Automation"  
    ],  
    "outdoor": [  
      "Football",  
      "Cricket"  
    ]  
  }  
}
```

Array

Object &  
Array

# Node-RED & IBM i

# Node-RED DB2 for i Adapter

- Latest version 0.2.3 dated 15/12/2022
- DB2 for i adapter - 2 Nodes
  - One node for configuration
  - One node for SQL
- Input
  - **msg.payload → SQL statement**
- Output
  - **msg.payload → SQL Result set**
    - Row mode - 1 payload per record (Default)
    - Array mode - 1 message per result-set in an array
- Error handling can be poor or non-existent!

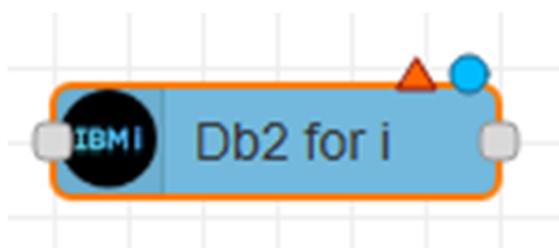

# Install DB2 for i Adapter

- Due to problems with IBMs DB2 for i adapter, sometimes it must be installed manually!
- From a shell session, in the `~/.node-red` directory
  - Install the pre-req's
    - `npm i idb-connector -g`
    - DB2 node
      - `npm i node-red-contrib-db2-for-i -g`
  - To confirm
    - `npm list -g`

# Install DB2 for i Adapter

```
SSH Galatea ✘ SSH Galatea ✘ + ▾
andy@GALATEA:~$ cd .node-red
andy@GALATEA:.node-red$ npm i -g idb-connector
added 60 packages in 8s

4 packages are looking for funding
  run `npm fund` for details
andy@GALATEA:.node-red$ npm i -g node-red-contrib-db2-for-i
added 61 packages in 6s

4 packages are looking for funding
  run `npm fund` for details
andy@GALATEA:.node-red$ npm list -g
/00openSvs/pkas/lib/nodeis20/lib
+-- corepack@0.17.2
+-- idb-connector@1.2.18
+-- node-red-contrib-db2-for-i@0.2.3
`-- npm@9.7.1

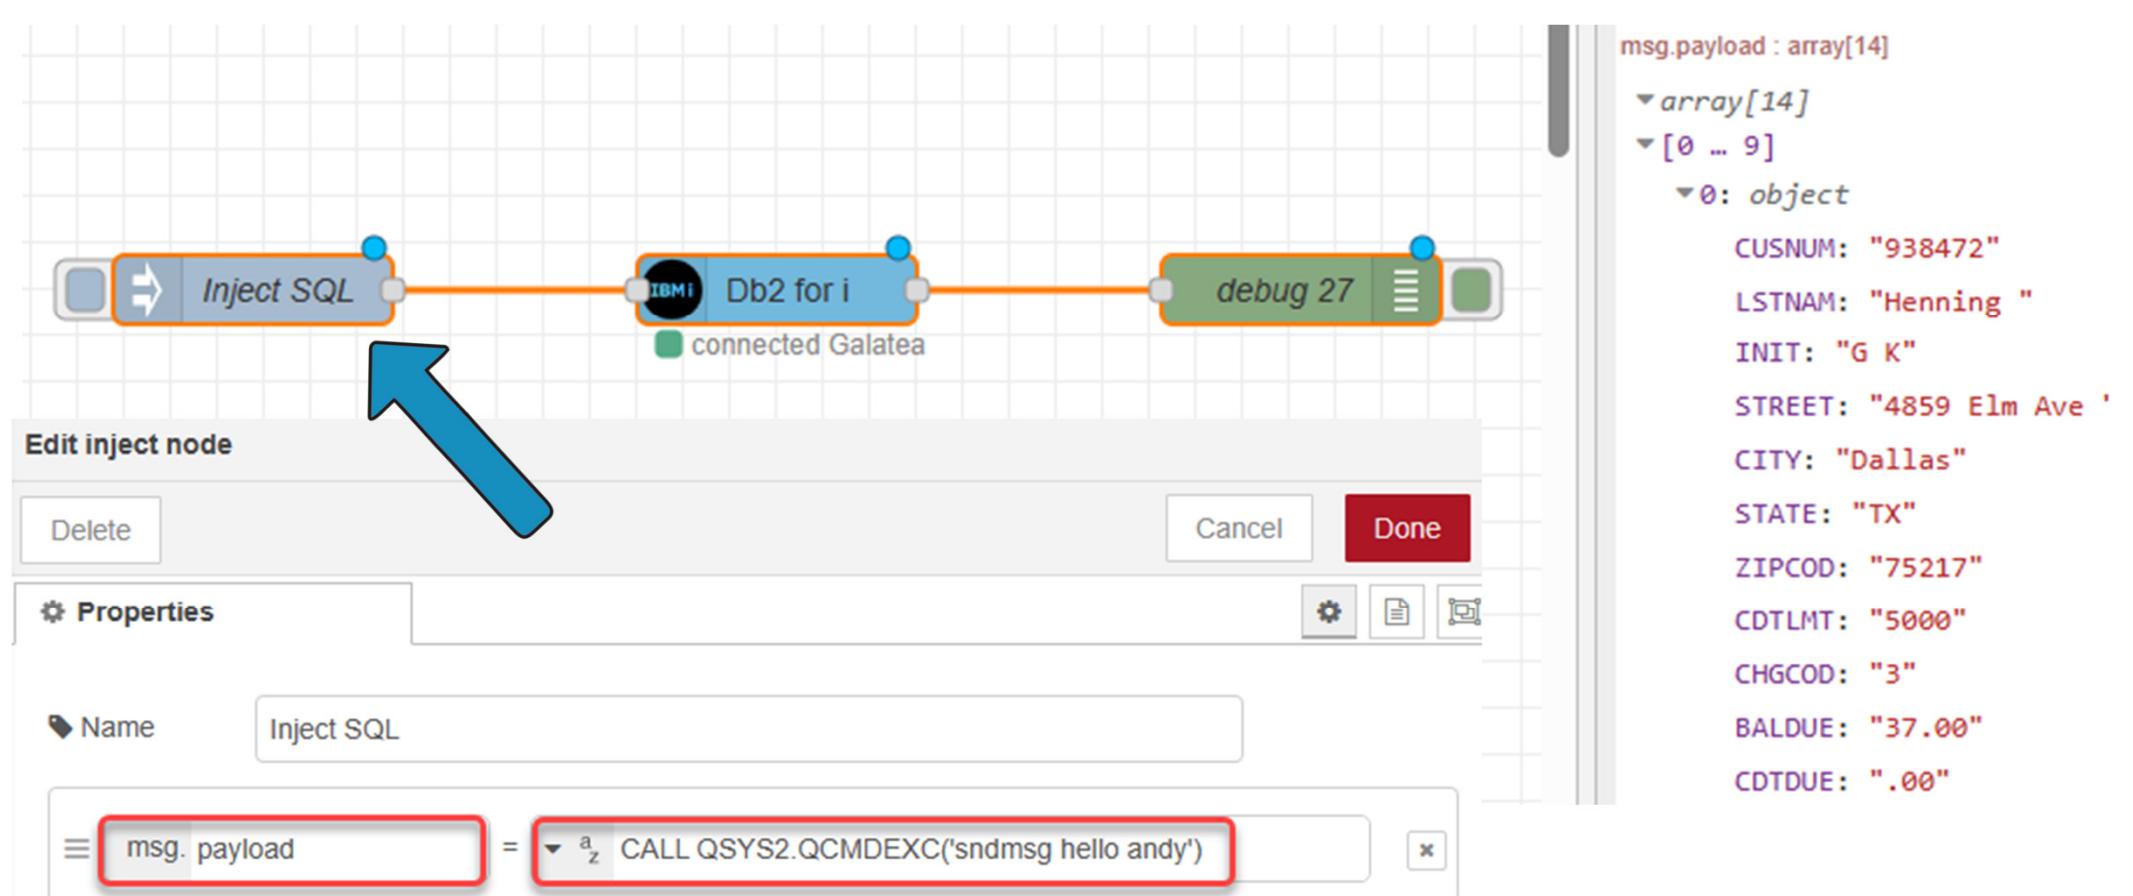

andy@GALATEA:.node-red$
```

# Demo & Exercise

---

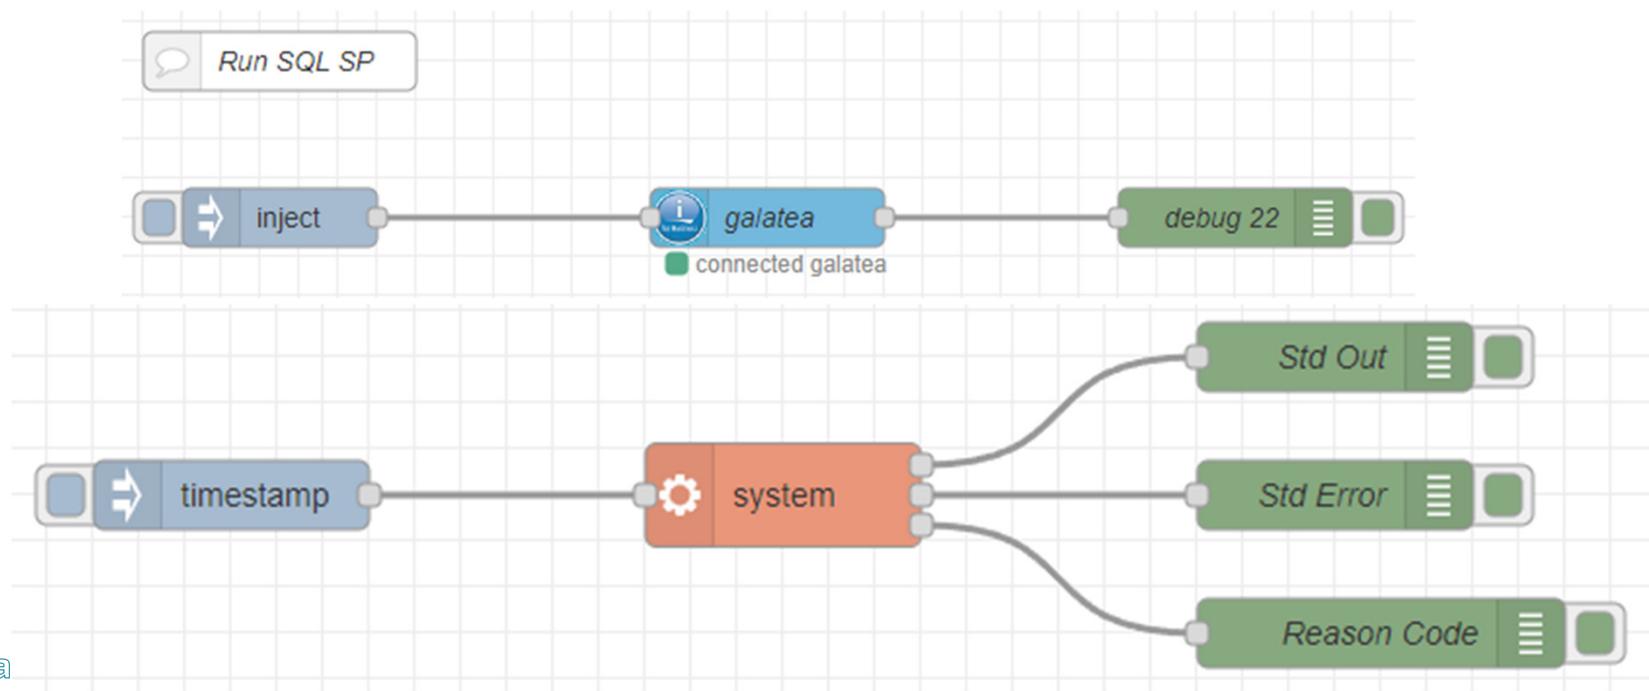

- Install the **DB2 for i** package, if you have not done so already
- Create a flow, that will output to the debug window, all records in the **QCUSTCDT** table in schema **QIWS**
- The **DB2 for i** node should return results in a single array

# Demo & Exercise

# Node-RED IBM i Bumph

- Calling a program or running command
  - Use **SQL Stored Procedures**
  - Use **Exec** node

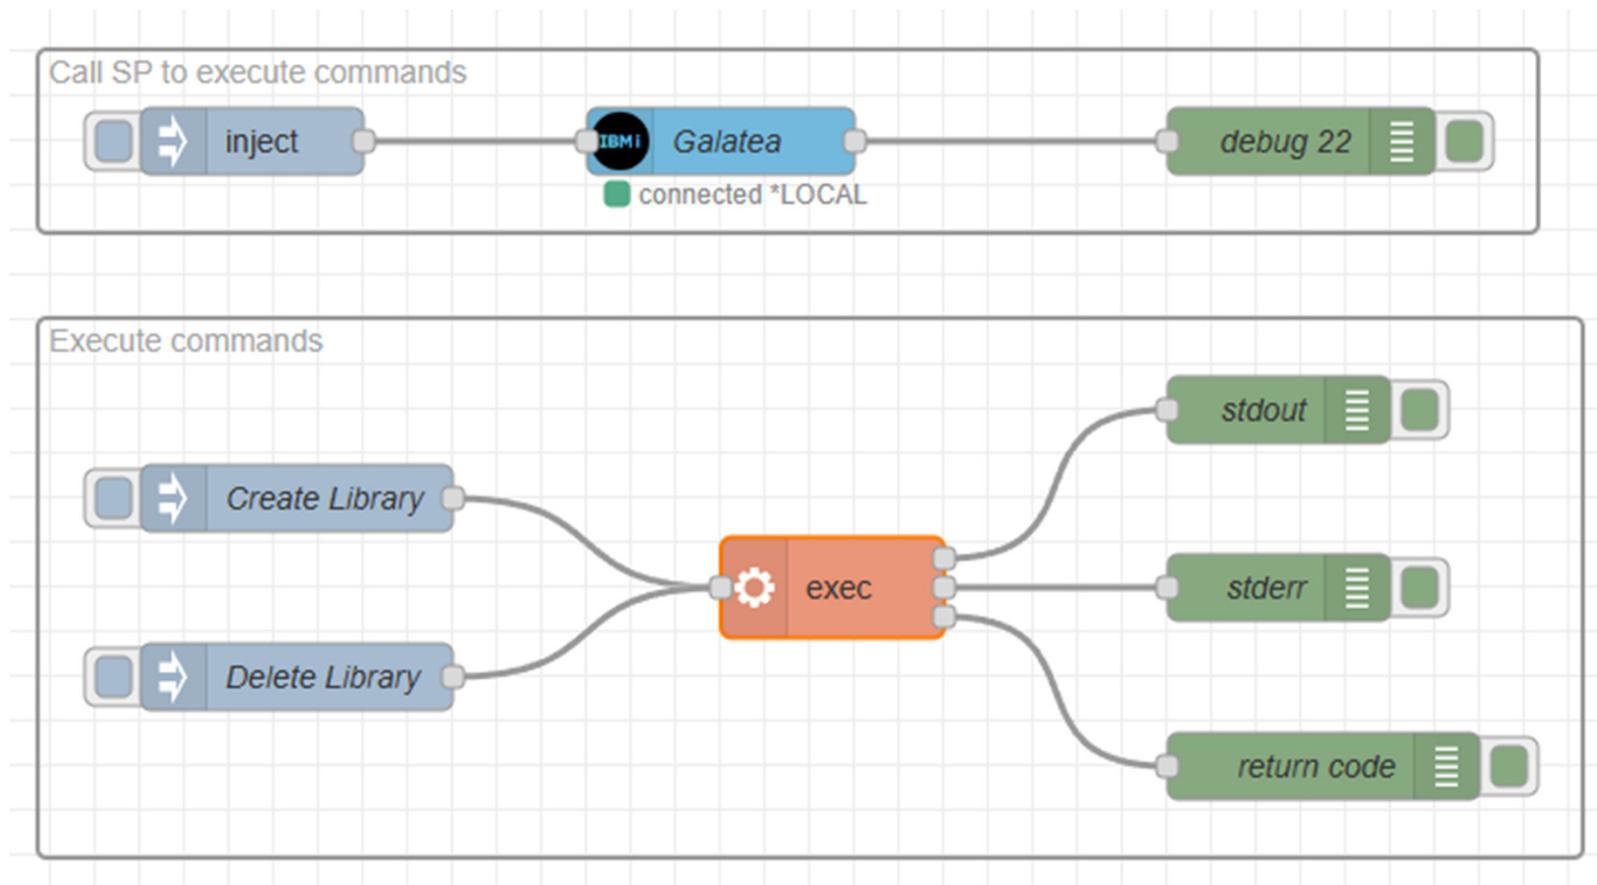

# Demo & Exercise

---

- ➊ Create a flow that will
  - ➌ Create a library on your server
  - ➌ Delete the same library on your server
  - ➌ Send a message to QSYSOPR

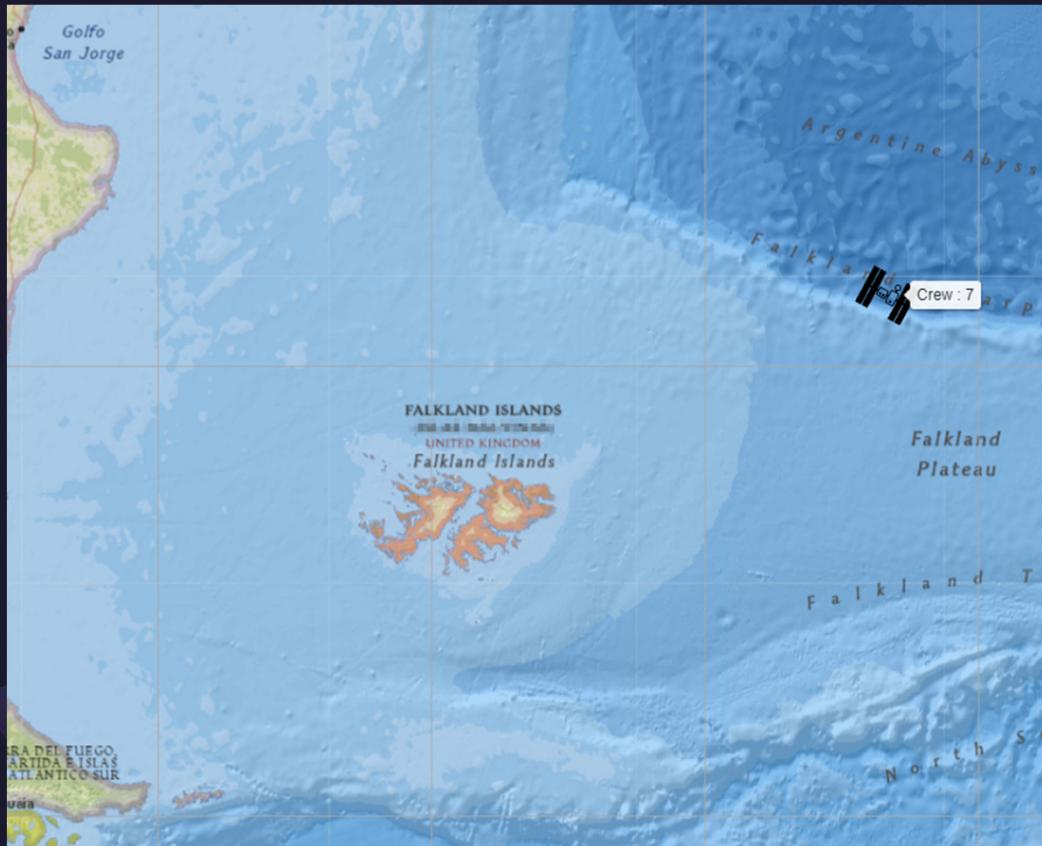

# Demo & Exercise

# A Couple of Extras

- International Space Station

- High & Low Tide Times

# Thank You!
